

Homework: Functions in Python

Task

Write a small Python program that:

1. Defines a function `area_of_rectangle(width, height)` that returns the area of a rectangle.
2. Defines a function `perimeter_of_rectangle(width, height)` that returns the perimeter of a rectangle.
3. Defines a function `describe_rectangle(width, height)` that returns **both area and perimeter** as a tuple.
4. In the main part of the program:
 - Call all three functions for a rectangle with width = 5 and height = 3.
 - Print the results clearly.
